

Dear Dr. McLean,

To begin with, I would like to say a huge thank you for arriving to school on Wednesday morning to teach me and my classmates.

I really appreciate the time you gave up to give us an opportunity that I will never forget - I loved all the fascinating facts you taught us and the explanations that were given to my questions. Despite having to deal with a class full of curiosity, I truly feel privileged that you have given me the chance to learn about the world of viruses and bacteria - there was lots of information to learn about (especially Covid-19).

Although all the activities were intriguing and engaging, one in particular really got me hooked - I was particularly eager to learn about injecting each with SARS-COV-2 (Covid-19): it proved to us that by staying away from people can

who aren't in your family bubble can prevent the risk of being infectious. You showed us that the barrier that develops when one person in your family gets vaccinated can protect other families from catching it - I will certainly take the key message away with me: it could save lives after all!

Along with learning about infecting each other, the activity that I did which included glitter really entertained me as I was finally allowed to disobey one of my teacher's rules; I was thrilled to have it all of it on my hands: the thought still excites me.

From simply having a little fun with glitter, I definitely now understand how coughing in your hands without washing it after can make others extremely vulnerable. Prior to this, I had no idea how washing our hands could make a huge impact on our lives; this action decreases the chance of getting the virus.

AA Not only did you take your time off on Wednesday, you came back on Friday to teach us more on-going knowledge. I didn't there was much more to learn about! I believe that I really enjoyed swabbing the table but I found it very fascinating how the least expected place turned out to be the dirtiest. This got me something to wonder about the bacteria that live outside! Therefore, it kept me with something to think about over the weekends. I also enjoyed the Kahoot quiz on antibiotics too, me and Holly had a right good laugh! Although it was fun, I became very frustrated choosing the answer under pressure with Holly shouting them in my ear - I won't forget the experience!

I hope my letter expresses the joy I had from learning Science.

Yours Sincerely, Hagsah
