
We consider that implementation of the WHO Action Plan on both a national and international level can have a positive impact on tackling the problems associated with AMR and will require the coordinated commitment of funding, expertise, and manpower.

Public Engagement

The first objective of the Global Action Plan is to improve awareness and understanding of antimicrobial resistance through effective communication, education, and training. As a group of UK-based learned societies with a combined worldwide membership of over 75,000, we are already working hard to ensure that antimicrobial resistance has a high profile both within our scientific communities and with the general public. Activities include public engagement events, scientific meetings, and facilitated professional networking.

Promoting research

We support the call for investment in research that is fundamental to understanding AMR and capable of eliciting new strategies to prevent, diagnose, and treat microbial infection. There is also a need to encourage and support skilled scientists to apply themselves to the relevant research questions.

We are pleased to be working with the UK AMR Funders Forum to ensure a coordinated approach to AMR research that will address the knowledge gaps identified in WHO Objective 2 – Strengthen the knowledge and evidence base through surveillance and research – in the Global Action Plan.

For example, we are running a series of professional networking events to bring together scientists across disciplines focusing on AMR in the environment.

In addition, we are promoting a ‘one health’ approach, i.e. interdisciplinary work to support health and wellbeing in humans and animals whilst also protecting the environment.

Financial investment

A recent report by The Review on Antimicrobial Resistance, which was commissioned by UK Prime Minister, David Cameron, recommends sustainable, stable, and supportive financial investment to allow for research that has a meaningful impact on AMR.

We agree with the WHO that if governments adopt the position that antimicrobial medicines are a public good, this could encourage commensurate public investment in promoting their rational use.
The lack of new antibiotic classes developed in recent years may be attributed to the fact that since these pharmaceuticals often represent drugs of last resort they may not recoup the development cost through sales – a view also shared by The Review on Antimicrobial Resistance. So, we additionally look to governments to address the dearth of R&D into new drugs and to support investigations into the repurposing of drugs to treat resistant infections.

**A global problem**

It is important to acknowledge that AMR is a global problem requiring both local and global action.

In particular, the global standardisation of monitoring and surveillance of resistant infections is desperately needed.

**About LeSPAR**

The Learned Society Partnership on Antimicrobial Resistance (LeSPAR) is a partnership of seven UK learned societies who have come together to support actions that can mitigate the global challenge of antimicrobial resistance. Collectively, these societies represent around 75,000 scientists.

LeSPAR aims to provide a single, unified voice and mobilise the UK’s collective research community in order to enhance understanding and knowledge-sharing between academia, industry and clinicians. The group is focused on taking action, championing best practice and raising awareness of the global challenge of antimicrobial resistance. LeSPAR will achieve these aims by:

- Supporting researchers in creating, sharing and applying knowledge.
- Organising focused events to enable networking and knowledge exchange, and to promote effective collaborations across disciplines and sectors.
- Engaging with government and other funders to achieve policy and funding support for the antimicrobial research community and connecting expertise from our membership to policy-makers.
- Assembling information on relevant resources and meetings.
